

"Live" Bibliographies for Eloquent WebSuite

December 23rd, 2004

At the bottom of this document you will find links to four sample "live" bibliographies. They are HTML files containing lists of selected records out of four different WebSuite databases. Three samples are lists of books in a traditional bibliographic format. The fourth is list of archival records. The lists are considered "live" because they can take you directly back into the database from which they came.

A full detail display of the item is retrieved, with the link, directly out of the appropriate WebSuite database wherever on the WWW it may be hosted. It, in turn, may have links to a variety of other displays:

- a picture of the book cover or the table of contents,
- a related Web page,
- a list of other items in the database by the same creator,
- a list of other resources on the same subject.

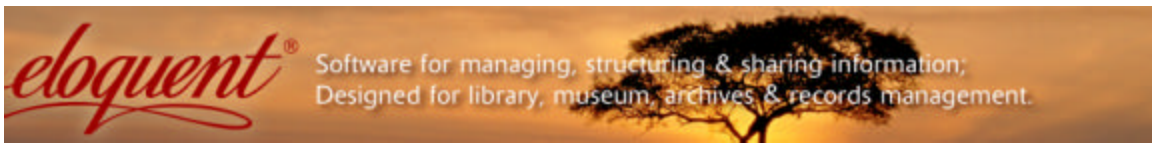

You can create this "live" bibliography just as easily as getting a printed one. You search for the desired items in the database and then select the appropriate "Go!" process. The HTML file will soon arrive as an email attachment. This HTML file can then be posted on a Website or sent by email to any number of people. Note that not all users need be given the ability to create these bibliographies.

This is a great facility for anyone doing research for other people. Some examples are:

- in response to a **reference question**,
- to promote **latest arrivals**,
- to prepare a **reading list** for a student assignment,
- to promote **seasonal topics**.

Here are four sample bibliographies. Look at them and follow the links into 4 different online databases:
